

## Introduction

Fraxious allows the generation of several different classes of fractal:

- Mandelbrot Set
- Julia Set
- Newton's Method
- Henon
- Strange Attractor
- 2-Dimensional Fractional Brownian Motion (FM2D)
- Lyapunov

The pictures generated may be saved and loaded into other programs. In addition, Fraxious can produce Quicktime movies between two fractals of the same type, allowing zooming and variation of continuous parameters between frames.

Creation of a fractal involves choosing the New **fractal type** menu item, changing the default parameters in the presented dialog box, and pressing OK.

Fraxious then generates the fractal in a window. The Colour Palette floating window allows the colours used to be changed.

When the fractal is saved, it is saved as a Macintosh PICT, with some additional resources. This means that it can be read by standard image-editing programs and word-processors.

## Starting the Program

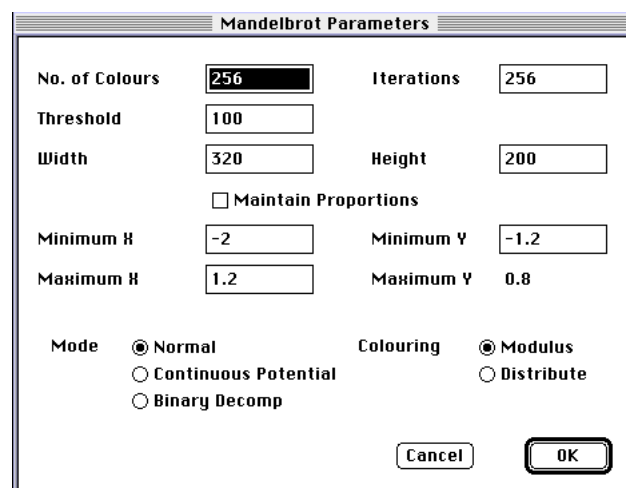

Double click on the Fraxious icon. Fraxious starts without any open windows. You must select New or Open from the File menu to create a fractal or open an existing fractal.

## The New Menu

Choose one of the fractal types from this menu to create a fractal.

## Simple Mandelbrot

This gives you the Mandelbrot Set for  $z^2 + c$ . The dialog box gives you a number of options for altering the final fractal:

The image shows a dialog box titled "Mandelbrot Parameters". It contains several input fields and radio buttons for configuring the fractal generation. The fields are arranged in a grid-like fashion. At the bottom, there are "Cancel" and "OK" buttons.

Mandelbrot Parameters	
No. of Colours	256
Iterations	256
Threshold	100
Width	320
Height	200
<input type="checkbox"/> Maintain Proportions	
Minimum X	-2
Minimum Y	-1.2
Maximum X	1.2
Maximum Y	0.8
Mode	<input checked="" type="radio"/> Normal <input type="radio"/> Continuous Potential <input type="radio"/> Binary Decomp
Colouring	<input checked="" type="radio"/> Modulus <input type="radio"/> Distribute
<div>Cancel OK</div>	

No. of Colours	The number of colours to be used in the picture. Choosing a number greater than 256 uses a lot of memory without much increase in picture quality.
Iterations	The maximum number of iterations to perform for each pixel. A higher figure gives a better detail fractal.
Threshold	If an iteration gives a result above this, it is assumed to have escaped to infinity. A higher value gives better detail.
Width, Height	Size of the fractal picture.
Minimum X, Minimum Y	The values on the complex plane corresponding to the top-left corner of the picture.
Maximum X, Maximum Y	The values on the complex plane corresponding to the bottom-right of the picture.
Mode: Normal	The normal mode of colouring — a pixel is assigned a colour number corresponding to how many iterations it took to escape to infinity:

Mode: Continuous Potential      Colouring by the continuous potential method:

Mode: Binary De-  
composition

Colouring in black-and-white by binary decom-  
position method:

Colouring:  
Modulus

If the number of iterations is greater than the  
number of colours, the colours are reused  
from colour zero.

Colouring:  
Distribute

If the number of iterations is greater than the  
number of colours, the colours are distributed  
over the number of iterations.

The Maintain Proportions Check Box, when checked, keeps Width and Height in proportion to each other.

## Simple Julia

This generates the Julia Set for  $z^2 + c$ .

The parameters dialog box for this fractal is the same as for Simple Mandelbrot, with the addition of the Real and Imaginary fields for inclusion in the Julia iterations:

Julia Parameters			
No. of Colours	<input type="text" value="256"/>	Iterations	<input type="text" value="256"/>
Threshold	<input type="text" value="100"/>		
Width	<input type="text" value="320"/>	Height	<input type="text" value="320"/>
<input type="checkbox"/> Maintain Proportions			
Minimum X	<input type="text" value="-2"/>	Minimum Y	<input type="text" value="-2"/>
Maximum X	<input type="text" value="2"/>	Maximum Y	<input type="text" value="2"/>
C: Real	<input type="text" value="1"/>	Imaginary	<input type="text" value="0"/>
Mode	<input checked="" type="radio"/> Normal <input type="radio"/> Continuous Potential <input type="radio"/> Binary decomp		
Colouring	<input checked="" type="radio"/> Modulus <input type="radio"/> Distribute		
		Cancel	OK

## Simple Newton

Newton's method for finding roots for the equation  $z^n - 1$ .

Most of the fields in the parameters dialog box are the same as for Simple Mandelbrot. An additional field, Degree, is the degree of the polynomial ( $n$  in  $z^n - 1$ ).

Newton Parameters			
No. of Colours	<input type="text" value="256"/>	Iterations	<input type="text" value="256"/>
Degree	<input type="text" value="3"/>		
Width	<input type="text" value="200"/>	Height	<input type="text" value="200"/>
<input type="checkbox"/> Maintain Proportions			
Minimum X	<input type="text" value="-2"/>	Minimum Y	<input type="text" value="-1.2"/>
Maximum X	<input type="text" value="1.2"/>	Maximum Y	<input type="text" value="2"/>
Colour Mode	<input type="radio"/> Iterations <input checked="" type="radio"/> Nearest root		
<input type="button" value="Cancel"/>		<input type="button" value="OK"/>	

Two methods of colouring are available: the Iterations method is the same as Mandelbrot and Julia; the Nearest Root method splits the palette into n sets, each corresponding to a root. Each pixel is coloured according to which root it converges to.

## Henon

Generates a Henon map according to the equations:

$$x_{n+1} = x_n \times \cos(a) - (y_n - x_n^2) \times \sin(a)$$

$$y_{n+1} = x_n \times \sin(a) + (y_n - x_n^2) \times \cos(a)$$

The initial values for x and y are determined from the initial value, final value, and number of steps on the Henon parameters dialog box:

**Henon Parameters**

Iterations	2048
a	1.335971
Initial Value	-0.1
Final Value	0.8
Steps	36
Width	200
Height	200
Minimum H	-2
Minimum Y	-1.2
Maximum H	1.2

Cancel OK

## Strange Attractor

**Attractor Parameters**

Dimension	2	Order	2
Width	800	Height	800
Iterations	2048		

Minimum H	-2
Minimum Y	-1.2
Maximum H	1.2

	H	Y
$H^2$	-0.5	0.1
$HY$	0.1	-0.3
$H$	-0.6	0.9
$Y^2$	0.2	0.3
$Y$	-0.7	-1
$1$	-1.2	-0.9

Open Cancel OK

Dimension is the number of unknowns in the equation: for example a dimension of three gives unknowns  $X$ ,  $Y$ , and  $Z$ . Order gives the highest power in the equation. The list box contains the coefficients of the terms for the equation. Select one and click on the **Open** button, or double-click on one, to bring up another dialog which allows you to change the coefficient.

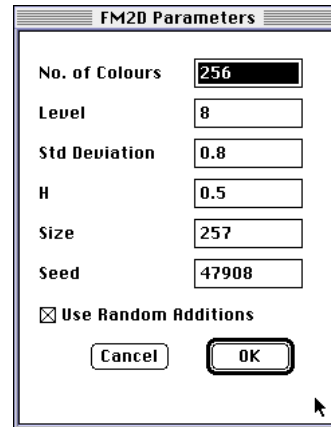

## FM2D

In the parameters dialog box, **Level** is the number of iterations through the main loop. In general, a level of  $n$  will give a good FM2D size of  $2^n + 1$ ; e.g. a level of 8 will give a good FM2D of  $257 \times 257$ . If you use a bigger **Size** than this, the picture will be stretched, and quality will be reduced.

**H** determines the fluffiness of the cloud. A low value (say 0.05) gives a fluffy cloud. A value of 1.0 gives a smooth cloud. **Seed** is the random number generator seed. If you keep all the other parameters the same, but change the seed, you get different clouds.

Checking **Random Additions** gets rid of some artificial ridge anomalies in the cloud.

## General Mandelbrot

As for Simple Mandelbrot, but includes an additional field for specifying the right-hand-side of an equation instead of using  $z_{n+1} = z_n^2 + c$ .

This allows fairly arbitrary equations to be built including the operators  $+$ ,  $-$ ,  $*$ ,  $/$ ,  $^$  (to the power of), brackets and nested brackets. The terms  $z$ ,  $c$ ,  $e$ , and  $\pi$  may be used, and also the functions  $\text{real}$ ,  $\text{imag}$ ,  $\text{abs}$ ,  $\text{norm}$ ,  $\text{arg}$ ,  $\text{conj}$ ,  $\text{cos}$ ,  $\text{cosh}$ ,  $\text{exp}$ ,  $\text{log}$ ,  $\text{sin}$ ,  $\text{sinh}$ ,  $\text{sqrt}$ ,  $\text{tan}$ ,  $\text{tanh}$ .

**Mandelbrot Parameters**

Z=

No. of Colours  Iterations

Threshold

Width  Height

☐ Maintain Proportions

Minimum X  Minimum Y

Maximum X  Maximum Y

Mode ☒ Normal ☐ Continuous Potential ☐ Binary decomp

Colouring ☒ Modulus ☐ Distribute

## General Julia

Like General Mandelbrot, General Julia is Simple Julia with an additional field for specifying the iteration equation.

**Julia Parameters**

Z

No. of Colours  Iterations

Threshold

Width  Height

☐ Maintain Proportions

Minimum X  Minimum Y

Maximum X  Maximum Y

C: Real  Imaginary

Mode ☒ Normal ☐ Continuous Potential ☐ Binary decomp

Colouring ☒ Modulus ☐ Distribute

## Lyapunov

The xy edit field requires a string of ones and zeroes. Currently the threshold field is ignored.

**Lyapunov Parameters**

xy

Iterations

Threshold

Width

Height

Minimum X

Minimum Y

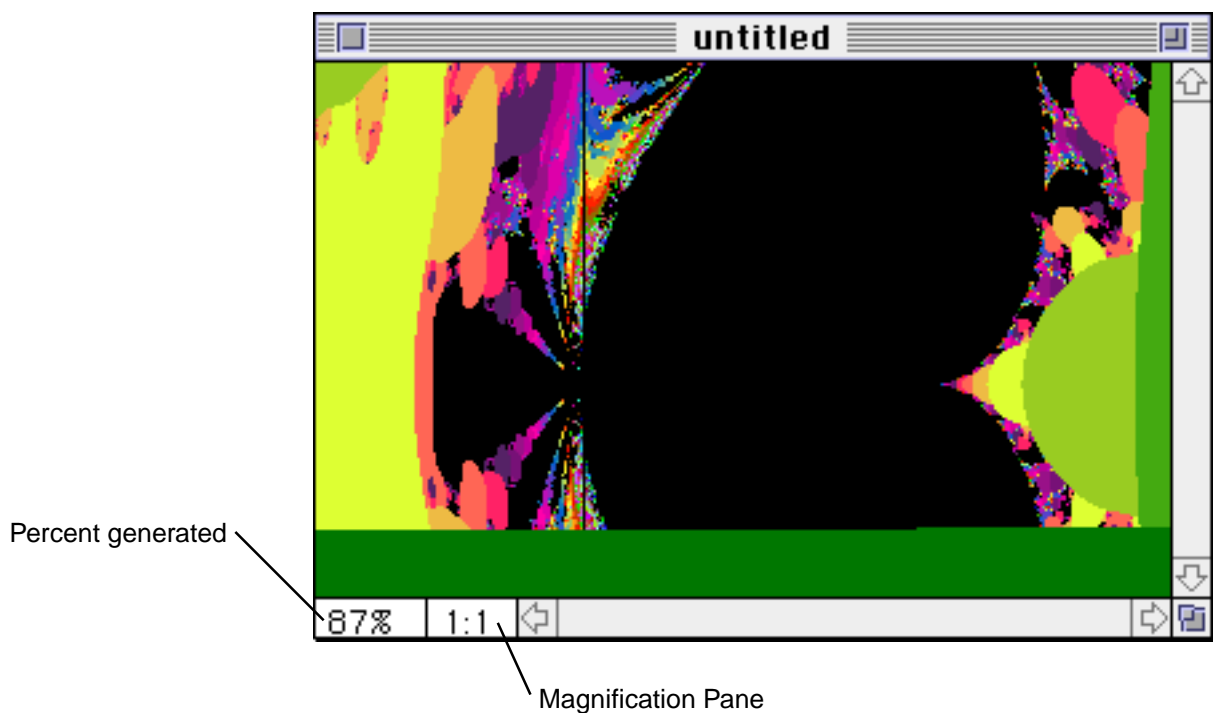

Maximum X

## The Document Window

The Document Window has the usual features of a Macintosh window, plus a couple of extra ones.

Note that the cursor turns to a crosshairs over the content region of the window. This means you can make a rectangular selection by dragging over part of the content region. The selection can be copied to the clipboard for pasting into another application,

or used to generate another fractal, zooming in.

If you click on the Magnification Pane, the cursor changes to a magnification glass. Click in the content region to magnify the image, shift-click to demagnify it. Click on the Magnification Pane again to return to selection mode (crosshairs).

## The Colour Palette

The colour palette floating window allows the fractal colours to be changed. Click on the colour in the list box to select it, and then adjust the sliders to achieve the colour you want.

You can select more than one colour by clicking on the first colour, then Command-clicking on additional colours. The Blend button then becomes enabled. Click on this to create a gradient between the selected colours.

If you hold down the Option key when over the content region of the document window, it changes to an eye-dropper. Click to select the colour under the dropper in the palette list box.

## The Special Menu

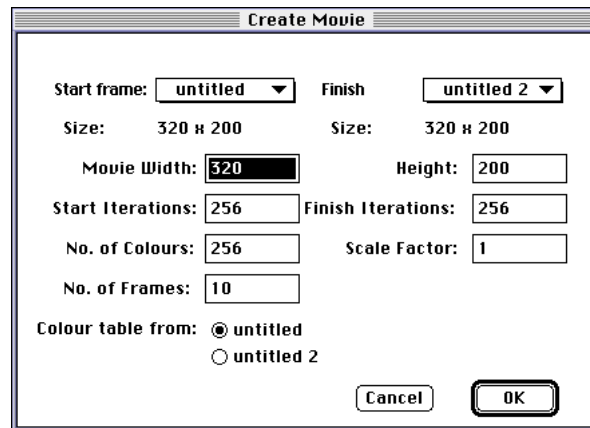

Parameters	Shows the parameters for the current fractal.
Selection Details	Gives the dimensions of the current selection, in terms of pixels and in terms of the complex plane.
Pause	Pause the current generation.
Resume	Resume a paused generation.
Generate Selection	Take the current selection and create a parameters dialog from it, in order to generate a new fractal.
Print Resolution	The resolution to print the fractal at.

## Creating a Movie

Movies can be created between fractals of the same type, e.g., between two Simple Mandelbrots, or between two Henons. Fraxious will attempt to create animation

frames between the two fractals, interpolating values that can be interpolated. Examples of possible animations are: zoom from a Simple Mandelbrot to another which has been created from a selection of the first; similar zoom from one Lyapunov to another; from one Henon to another with a different a value; from one Julia Set to another with different Re and Im values; from a General Mandelbrot of  $z^2 + c$  to one of  $z^{15} + c$ .

To create an fractal animation, choose New Movie É from the Movies menu. You will then be presented with a dialog box like this one (the details will vary between fractals):

A screenshot of a 'Create Movie' dialog box. It contains several input fields and controls. At the top, 'Start frame:' is set to 'untitled' and 'Finish' is set to 'untitled 2'. Below these, 'Size:' is '320 x 200' for both. 'Movie Width:' is '320' and 'Height:' is '200'. 'Start Iterations:' and 'Finish Iterations:' are both '256'. 'No. of Colours:' is '256' and 'Scale Factor:' is '1'. 'No. of Frames:' is '10'. At the bottom, 'Colour table from:' has two radio buttons: 'untitled' (selected) and 'untitled 2'. 'Cancel' and 'OK' buttons are at the bottom right.

Note that you can change the size of the movie, and also number of iterations, and number of colours. A scale factor of more than 1 causes the fractal to be rendered in an expanded area and then dithered into the final movie size, giving a sort of anti-aliasing. This is useful for black-and-white images which otherwise look jagged (but remember to choose grayscale rather than Black-and-White in the compression dialog).

Following this dialog, you will be presented with the standard Macintosh compression dialog and standard Save dialog.

Open Movie É will allow you to play back the movie. Alternatively, you can play it with Movieplayer or similar program.

## Memory Requirements

There is a large variation between the memory requirements for different fractals. FM2D needs a lot of memory as it uses a large array of floating point numbers. Using more than 256 colours uses a lot of memory, as does the Continuous Potential Method, and, of course, the bigger the fractal, the more memory it uses.
