Red Hat uses Fedora to test and perfect technologies that will appear in Red Hat Enterprise Linux. Fedora provides an advance look at where Red Hat is heading in future releases.

Fedora Core 4 comes with an up to date collection of Linux components and supporting applications. The system is equipped with Linux kernel 2.6.11, and you can choose either the KDE 3.4 or Gnome 2.10 desktop. You'll also find a pre-release version of OpenOffice 2.0, along with an array of other popular desktop tools.

SYSTEM REQUIREMENTS

Memory: 192 MB minimum; 256 MB recommended.

Hard disk: 620 MB minimum; 2.3 GB recommended for personal desktop systems.

Yum

The simple, convenient Yum software management system lets you install and manage software components in Fedora Core. Yum is a complete software management tool for rpm package systems. You'll find that Yum is an easy, convenient, and reliable tool for installing a vast collection of desktop applications. Yum even has an update option that updates your whole Fedora Core system. The Yum software management tool automatically checks and solves dependency issues, letting the user operate effectively with only a few minimal commands.
Fedora Core 4 also includes the optional Security Enhanced Linux (SELinux). SELinux is a Linux kernel patch and a collection of accompanying utilities designed to provide an extensive access control framework.

Easy Installation

If you decide to install Fedora Core 4, it won't take you long to get your system up and running. Fedora's Anaconda installer is a simple and versatile tool for installing and configuring your Fedora Core 4 Linux system. You can run Anaconda locally or include it as part of a network installation. The Anaconda installer automatically identifies hardware and analyzes system resources, presenting installation options through a clear and simple interface.
