1. Overview

OOodi provides a dictionary installer for OpenOffice.org on Unix platforms. The program is written and tested on Linux but should be portable to other Unix platforms.

OOodi will download a file describing available dictionaries (`available.lst`) from <http://dict.progbits.com> (or your choice of alternate site) and allow the user to select dictionaries to be installed. For OpenOffice.org v1.0, dictionaries are installed in the user's private directory. OpenOffice.org v1.0.1 will also allow a privileged user to install shared dictionaries in the system wide OpenOffice.org directory.

For OpenOffice.org v1.0.1, hyphenation dictionaries are also supported by [OOodi](#).

2. Installation

[OOodi](#) is provided (by the author) in two forms, either as a source archive or a Linux binary archive.

2.1. Source Archive

The source archive has dependencies on the following:

- [GTK+](#)
- [libcurl](#). You are advised to use libcurl 7.9.5 or later.
- libpopt

To build and install the source distribution, unpack the archive to a suitable location, then:

```
./configure
make
make install (as root)
```

2.2. Binary Installation

2.2.1. Binary Formats

The precompiled binary is available in a number of formats:

- epm portable tar file (.tar.gz)
- rpm
- deb

The precompiled binary is available in two flavours:

oodi

Depends on X11, GTK+, popt

oodi-static

No dependencies

If GTK+ is installed on your system, then you should choose **oodi** which is built against a static libcurl.

If GTK+ is *not installed* on your system, then you should choose **oodi-static**.

The reason for this is that a version linked statically against GTK+ may not work correctly when your GTK+ theme uses a dynamic library GTK theme.

2.2.2. Performing an installation

epm ([Easy Package Manager](#)) is used to create all binary distribution formats. To install the portable distribution:

- Unpack the archive in a scratch directory (/tmp for example).

```
tar -xzvf oodi-0.53-i386-linux.tar.gz -C /tmp/
```

- As root, run the script /tmp/oodi.install (or /tmp/oodi-static.install for the static variant).

```
# /tmp/oodi.install
```

or

```
# /tmp/oodi-static.install
```

- To bypass the *Are you sure/do you accept this licence* questions, use:

```
# /tmp/oodi.install now
```

or

```
# /tmp/oodi-static.install now
```

- A script to remove the software is also installed (/etc/software/oodi.remove or /etc/software/oodi-static.remove).

To install the .deb or .rpm distributions, use the standard tools on your system.

2.2.3. Binary dependencies

[OOodi](#) uses the InfoZip **unzip** program to unpack dictionary archives. **unzip** is usually supplied as part of a Linux distribution and is available for most commercial UNIXs. InfoZip may be downloaded, if required, from the [InfoZip web site](#).

3. Configuration

The first time it runs, [OOodi](#) creates a directory `~/ .ooodi`. It writes a (hidden) gtkrc file (`.gtkrc`) in this directory, which defines the fonts and sizes used for some labels for Western European fonts. [OOodi](#) is internationalised; translations are available for French, German, Greek, Italian and Japanese. Contributions of language files for other languages are welcome.

A file `~/ .ooodi/ooodi.rc` is also used. This file is maintained by the [Preferences](#) page. It allows, *inter-alia* the use of an HTTP proxy, if required (and a proxy user name).

The [Preferences](#) page is available from a right mouse popup menu, the Settings→Preferences menu or at startup if the `available.lst` file is not found.

From version 0.51, a menu bar is implemented. The menu options are essentially those available from the popup menu, with the addition of the [Repair](#), [Update Dictionary List](#), [Copy old version](#), and [Help](#) entries.

4. Usage

4.1. Getting Started

`OOodi` is invoked by the command `OOodi` (note capitalisation is significant). When invoked by a unprivileged user, it can install and remove dictionaries from that user's private directory. If the user has write access to the system-wide shared dictionary area (for [OpenOffice.org](#) v1.0.1), then the user may install or remove system wide shared dictionaries. The root user may invoke `OOodi` with an additional option to allow installation and removal of shared dictionaries even if the root user does not have a personal [OpenOffice.org](#) installation (see [here](#) for further details). If the root invokes the program without the option, the a file selector is displayed to locate the installation directory.

```
$ OOodi [--base=directory]
```

The `--base=dir` option is only available to the root user and defines where [OpenOffice.org](#) installation directory for (see [shared dictionaries](#)).

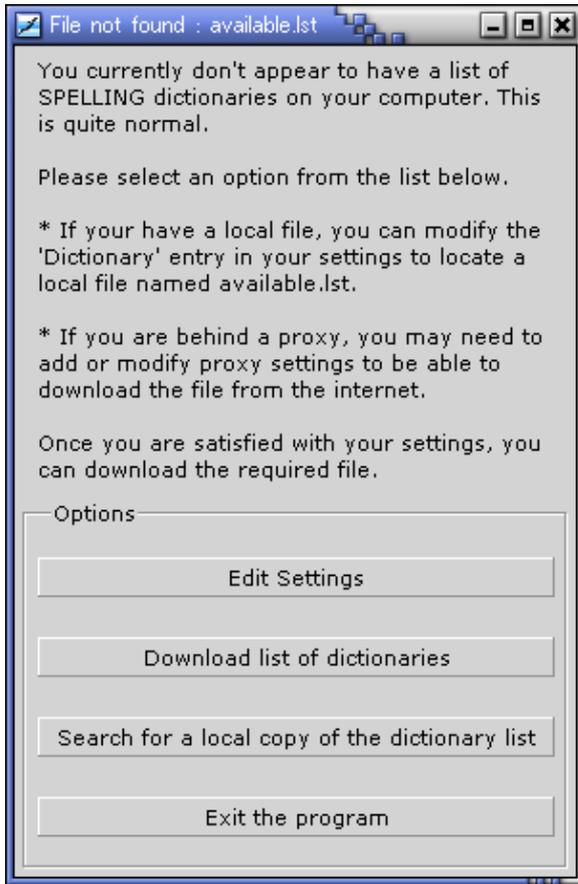

Normally, `OOodi` is invoked as:

```
$ OOodi
```

If a file defining the available dictionaries is available in the source directory defined by your preferences (or the current directory if you haven't defined a source directory), then the opening window is displayed, listing the available dictionaries and the user (U) and shared (S) dictionaries installed (indicated by a green tick). The final column in the list annotates the type of dictionary, either *Dict* for a spelling dictionary, or *Hyph* for a hyphenation dictionary. Hyphenation dictionaries are also colour-coded with a different background colour. Hyphenation dictionaries are only included if the [Include hyphenation dictionaries](#) preference is set. An asterisk after the type indicates that a more recent dictionary is available for download. The check is accessed from the [Tools->Update Dictionary List](#) menu option.

If a local available .lst file is not found, then the user is presented with a number of options:

Edit Settings

Before you attempt to download a list of available dictionaries from the Internet, you may wish to edit your network options. Selecting this item will invoke the [Preferences](#) dialogue.

Download list of dictionaries

This option will attempt to download the list of available dictionaries from <http://dict.progbits.com> (or the URI entry in your [preferences](#)).

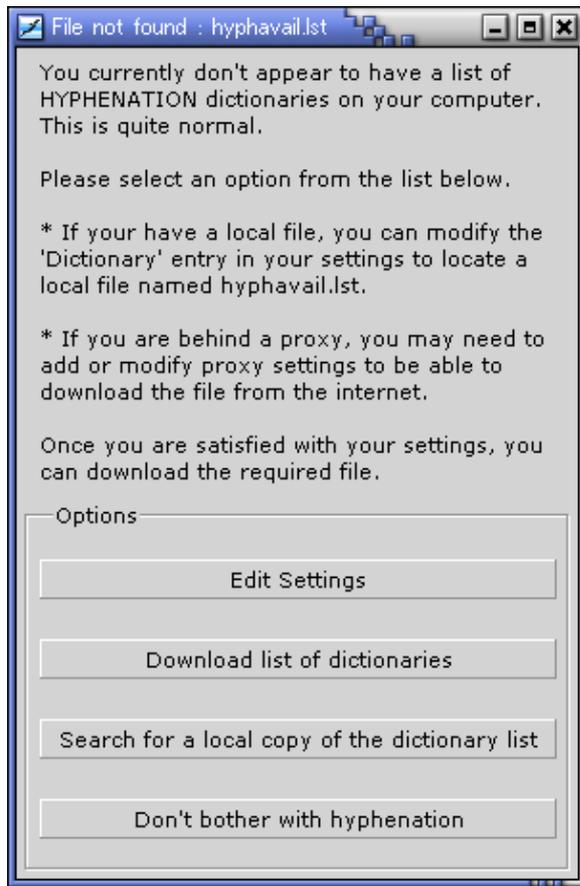

Search for a local copy of the dictionary list

This option will display the GTK+ file selection window. You can select an existing `available.lst` in a different directory. The program enforces a restriction that the file must be named `available.lst` and must be readable by you.

Exit the program

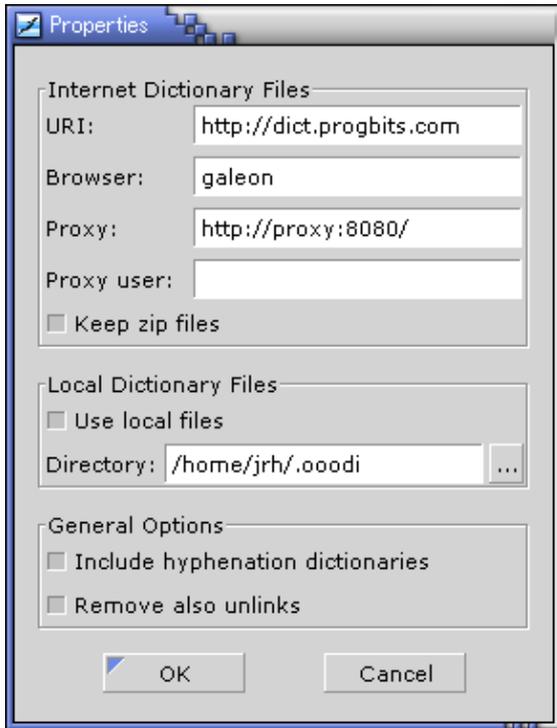

Just in case it all gets too much!

If the [Include hyphenation dictionaries](#) preference is set, but the `hyphavail.lst` file is not found, then a similar dialogue is displayed. In this case it is possible to continue without using hyphenation dictionaries. The file selector will require `hyphavail.lst`.

4.2. Preferences

Preferences are accessed either from the startup options, the Settings→Preferences menu or from a right mouse button popup menu.

URI

The address of the site holding the dictionary list and available dictionaries. The default is set to <http://dict.progbits.com> You should only change this if the dictionary site changes or you know better.

Browser

[OOodi](#) uses a browser to display its help pages. The browser will also be invoked for the link from the **About** box to the [OOodi](#) home page. If you don't define a browser, [OOodi](#) attempts to locate and use one of galeon, mozilla or netscape, in that order.

Proxy

If there is a proxy between you and the Internet, then you should enter the proxy details here.

Proxy User

If you are behind a proxy and you have to supply a user name (and password) to access the proxy, then you should enter the user name here. You will be prompted for the password when you attempt to download information. [OOodi](#) does not store your password.

Keep zip files

If this option is checked, then the downloaded zip files containing dictionary data files are retained in the [Directory](#). This enables the installer to reinstall such dictionaries without having to download them again if [Prefer local files](#) is checked.

Prefer local files

If this option is checked, then [OOodi](#) will attempt to use local zip files containing dictionary data before downloading such files from the Internet. [OOodi](#) expects to find such files in the [Directory](#) (or current directory if the [Directory](#) is undefined).

Directory

The directory in which [OOodi](#) stores the list of available dictionaries and downloaded zip files containing dictionary data. Note that the zip files are only retained if the checkbox [Keep zip files](#) is checked. If zip files are retained, they can be reinstalled again if the [Prefer local files](#) entry is checked. The first time the program is run, this directory is set to `$HOME/.ooodi`.

The Directory can be changed by clicking on the ellipsis (...). A file selector will be displayed allowing the user to choose an alternate directory.

-  After the initial list of dictionaries has been downloaded, [OOodi](#) will attempt to use this local dictionary list. If you want a new dictionary list, just delete the `available.lst` (and/or) `hyphavail.lst` file(s). The next time you run [OOodi](#) it will download new lists. Alternatively, you can use the [Update Dictionary List](#) menu option to check that your local files are current.

Include hyphenation dictionaries

If this option is checked, [OOodi](#) will also maintain [OpenOffice.org](#) v1.0.1 hyphenation dictionaries and will expect to find or download a list of available hyphenation dictionaries (`hyphavail.lst`).

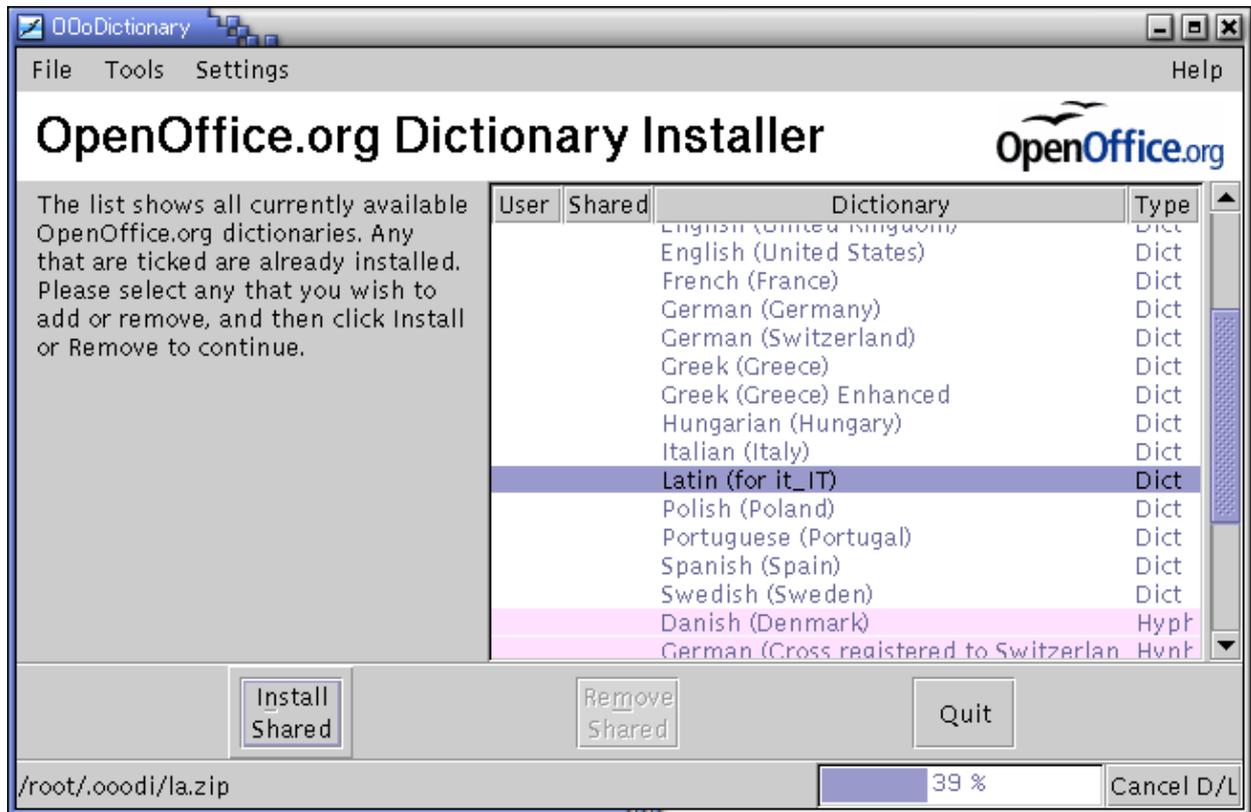

Remove also unlinks

If this option is checked, then when you remove dictionary entries, the data files `*.dic` and `*.aff` are also deleted. This will prevent the [Repair](#) menu option from being able to rebuild your installed dictionary list from the data files.

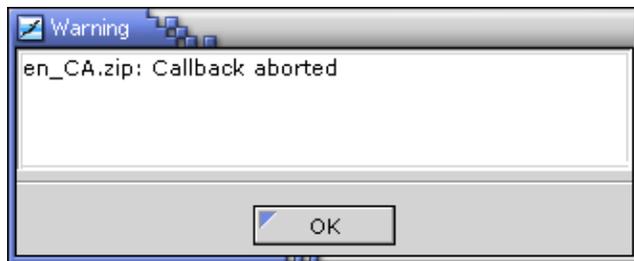

4.3. Installing and Removing Dictionaries

Once the list of available dictionaries is displayed, dictionaries may be selected for installation or removal. Once items have been selected, the **Install** and **Remove** buttons are available if you have a local [OOodi](#) installation. If you are running [OpenOffice.org](#) v1.0.1 or later and have write access to the shared dictionary directory, then the **Install Shared** and **Remove Shared** buttons are also enabled.

Dictionaries may be installed or deleted by pressing the appropriate button. If necessary, the dictionary file will be downloaded from the Internet. In this case, the file name and progress will be shown in the status bar, and the **Cancel D/L** button is enabled. The screenshot illustrates the root user installing a shared dictionary.

if you cancel a download or errors occur, a dialogue will be displayed.

4.4. Shared Dictionaries

Shared dictionaries may be installed either by:

- A user with a current OpenOffice.org installation in their home directory and write access to the shared dictionary area. A symbolic link from the user area is followed to determine the shared dictionary area.
- The root user. As root is unlikely to have a local OpenOffice.org installation, a file requester is displayed enabling root to define the base of the OpenOffice.org installation (as the [--base=dir command line option](#)).

4.5. Menu Options

A number of options are available only from the menus.

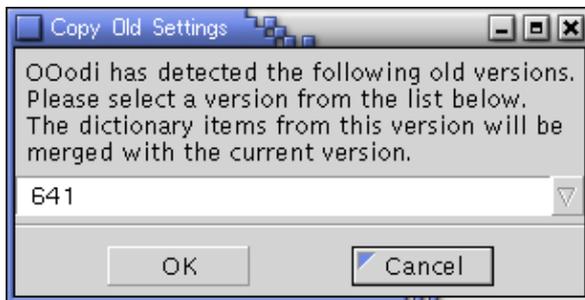

Tools→*Repair*.

If you have *not* checked the [Remove also unlinks](#) preferences item, then selecting the Repair option will rebuild your list of installed dictionaries from any dictionary data files it finds in the user dictionary area.

Tools→*Copy old version*.

This option will merge the user dictionary entries from compatible (i.e. [OpenOffice.org](#) v641 and later) versions into your current user dictionaries.

The list of old versions is displayed in a combo box. Choose the version required and press **OK**. If no compatible versions are found, then this item is not available.

Tools→*Update Dictionary List*.

This option will cause [OOodi](#) to perform the following checks:

- ◆ Verify that the local file `available.lst` is current. If it is not, then download the latest version from <http://dict.progbits.com> (or the location set in preferences).
- ◆ If [Include hyphenation dictionaries](#) is checked, verify that the local file `hyphavail.lst` is current. If it is not, then download the latest version from <http://dict.progbits.com> (or the location set in preferences).
- ◆ For each currently installed dictionary, verify that the dictionary is current. This is done by firstly checking the local zip files against the latest version from <http://dict.progbits.com> (or the location set in preferences), or if a local file is not available, checking the installed dictionary `*.dic` file. Note that checking the local dictionary file is likely to give false positives, as the contents from the zip files will necessarily be older than the zip file itself. In order to mitigate this, an arbitrary offset of one week is applied to the dictionary file date.

Help→*Help*.

This option will invoke your [browser](#) to display this document.

4.6. Diagnostics

When **Install** is clicked, the program (attempts to) download the selected dictionaries from <http://dict.progbits.com>. The download is checked for a ZIP signature. If the file is a zip file, then the `.dic` and `.aff` files are installed under `user/wordbook` and `dictionary.lst` is updated. If the file is not a valid zip file, then the file is preserved as `xx_XX.zip.failed`. This may contain a HTTP or proxy error message. Likewise, if the program repeated fails to download a valid list of available dictionaries, then the

available.lst file may contain a HTTP or proxy error message.

5. Selecting Dictionaries in OpenOffice.org

This is the quick explanation of how to use your newly installed dictionaries in OpenOffice.org. If you want a better explanation, then you should read Lee Corbin's [document](#) from the Windows [DictInstaller](#) project.

1. Download all required dictionaries using [OOodi](#)
 2. If you're using the QuickStarter, then disable it
 3. Select Tools / Options / Language Settings / Writing Aids
 4. Select Edit
 5. Select from the Language pulldown list. The downloaded dictionaries have an 'ABC' logo next to them. Check the 'OpenOffice MySpell Spellchecker' box.
 6. Select Close
 7. Select Languages. Ensure the correct 'Default Language for Documents' is shown.
 8. Select OK
 9. Restart OpenOffice.org (or re-enable the QuickStarter). Enjoy spell checking.
-

6. Bugs and Omissions

The program cannot distinguish between two different dictionaries where the locale code is the same (eI_GR and eI_GR_enhanced and it_IT and it_IT_latin). Fixing this in [OOodi](#) would be quite ugly. As [OpenOffice.org](#) v1.01 will allow multiple dictionaries for a given locale, then hopefully the names in the dictionary distributions will be modified to make this problem go away.

7. Author and Licence

OOodi is (c) Jonathan Hudson <jrh@openoffice.org>, 2002. This software is released under the LGPL (please see the file COPYING included with the source archive for further information).

Mark Finlay <sisob@eircom.net> who maintains the [Evolvedoo](#) site has improved the user interface.

Bug reports, translations and change requests are welcomed. I am grateful to Marco Huggenberger (de_DE), Takeshi Aihana (ja_JP), Michalis Kabrianis (el_GR), Andrea Sanavia (it_IT) and Andre Mazouer (fr_FR) for their translations. Any omissions are entirely mine as OOodi has been something of a moving target.
